

Flogr Installation Instructions

Pre-requisites

The following are required in order to use Flogr.

- ColdFusion MX 7.02
- Flash Player 9.
- Microsoft SQL Server – *other DB support soon.*
- Access to the admin API.

Installation

1. Un-zip the `flogr` directory to the web root of your site.
2. Create a blank database on your DB server.
3. Create a ColdFusion datasource that points to this database. *Make sure the user account used to access the DB has rights to create and drop tables.*
4. Browse to **`http://{web site}/flogr/install/install.cfm`**.
 - Enter the password for CF Administrator
 - Choose which datasource Flogr will use (This should be the datasource you created in step 3.)
 - Give a name to the directory watcher gateway.
 - Specify, in minutes, how often the directory watcher gateway will process changes to log files.
 - *This process may take a while.*
5. Browse to **`http://{web site}/flogr`**

Known Issues

The charting portion of Flogr is being re-written and should be available shortly.
